

OPERATION MARTINS

Simulated Breach Investigation & SOC Defense Architecture

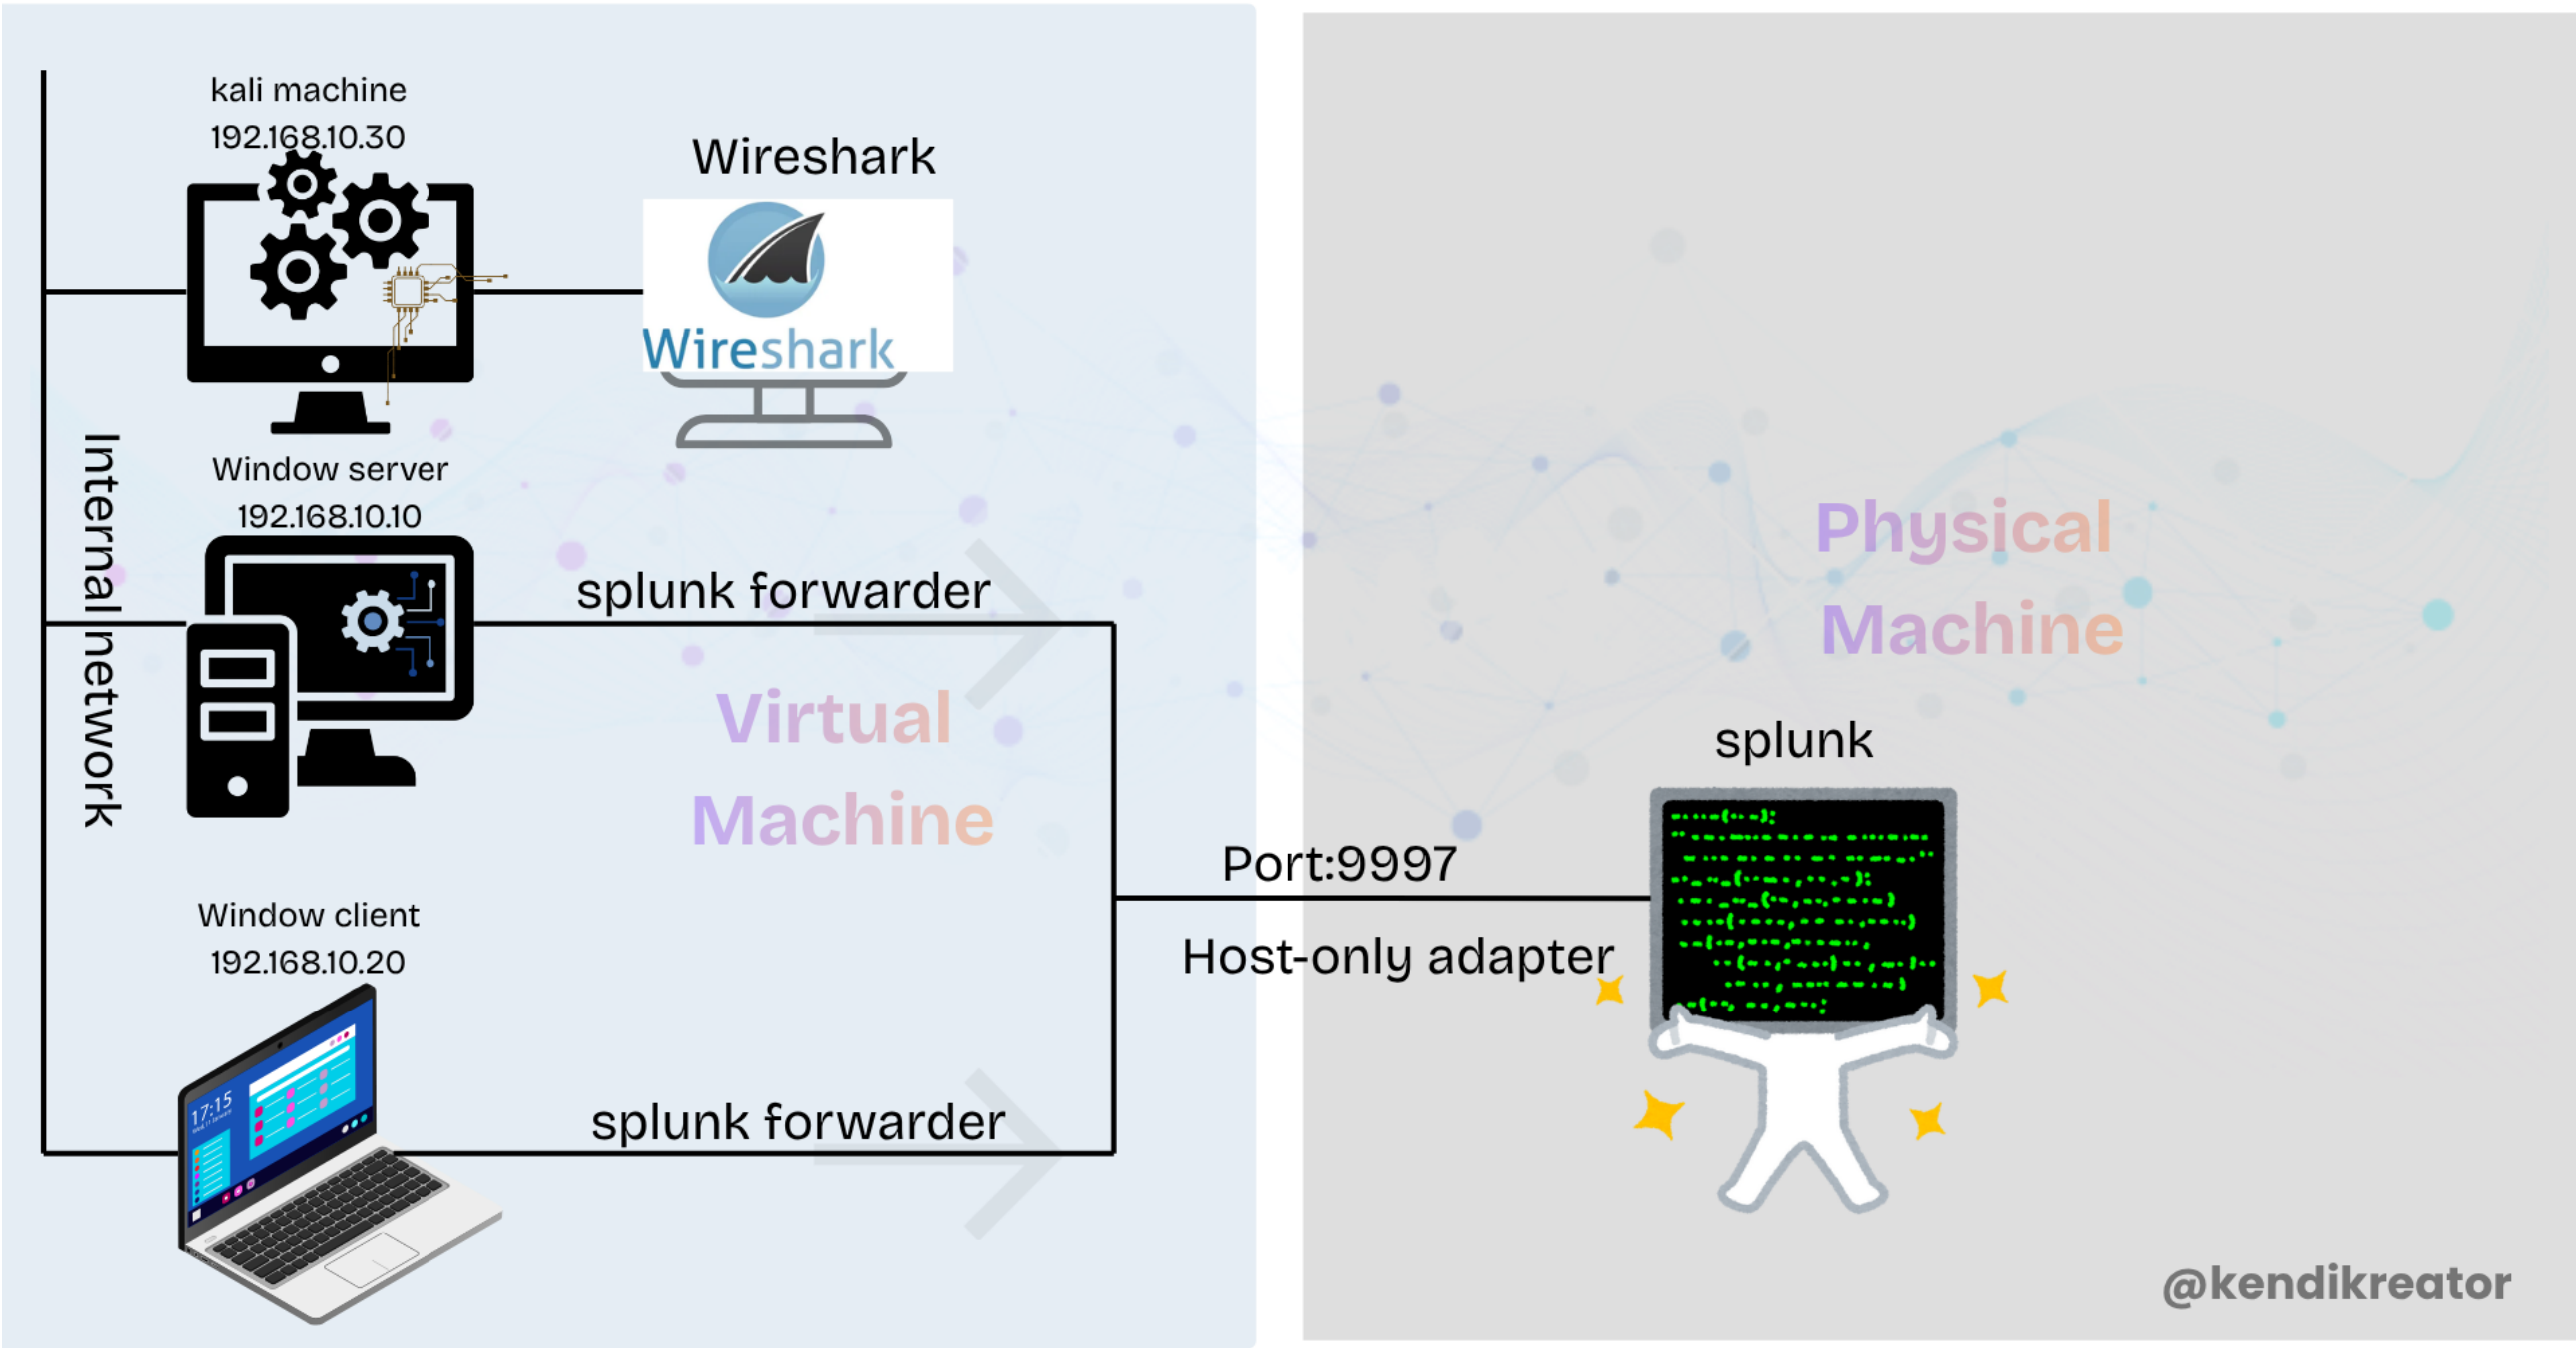

Target Organization: MartinsPay Technologies / Martins Logistics

Environment: Isolated Virtual Testbed (soc-sandbox)

Lead Security Investigator / Defense Presenter

MARTINS JESUROBO PROJECT

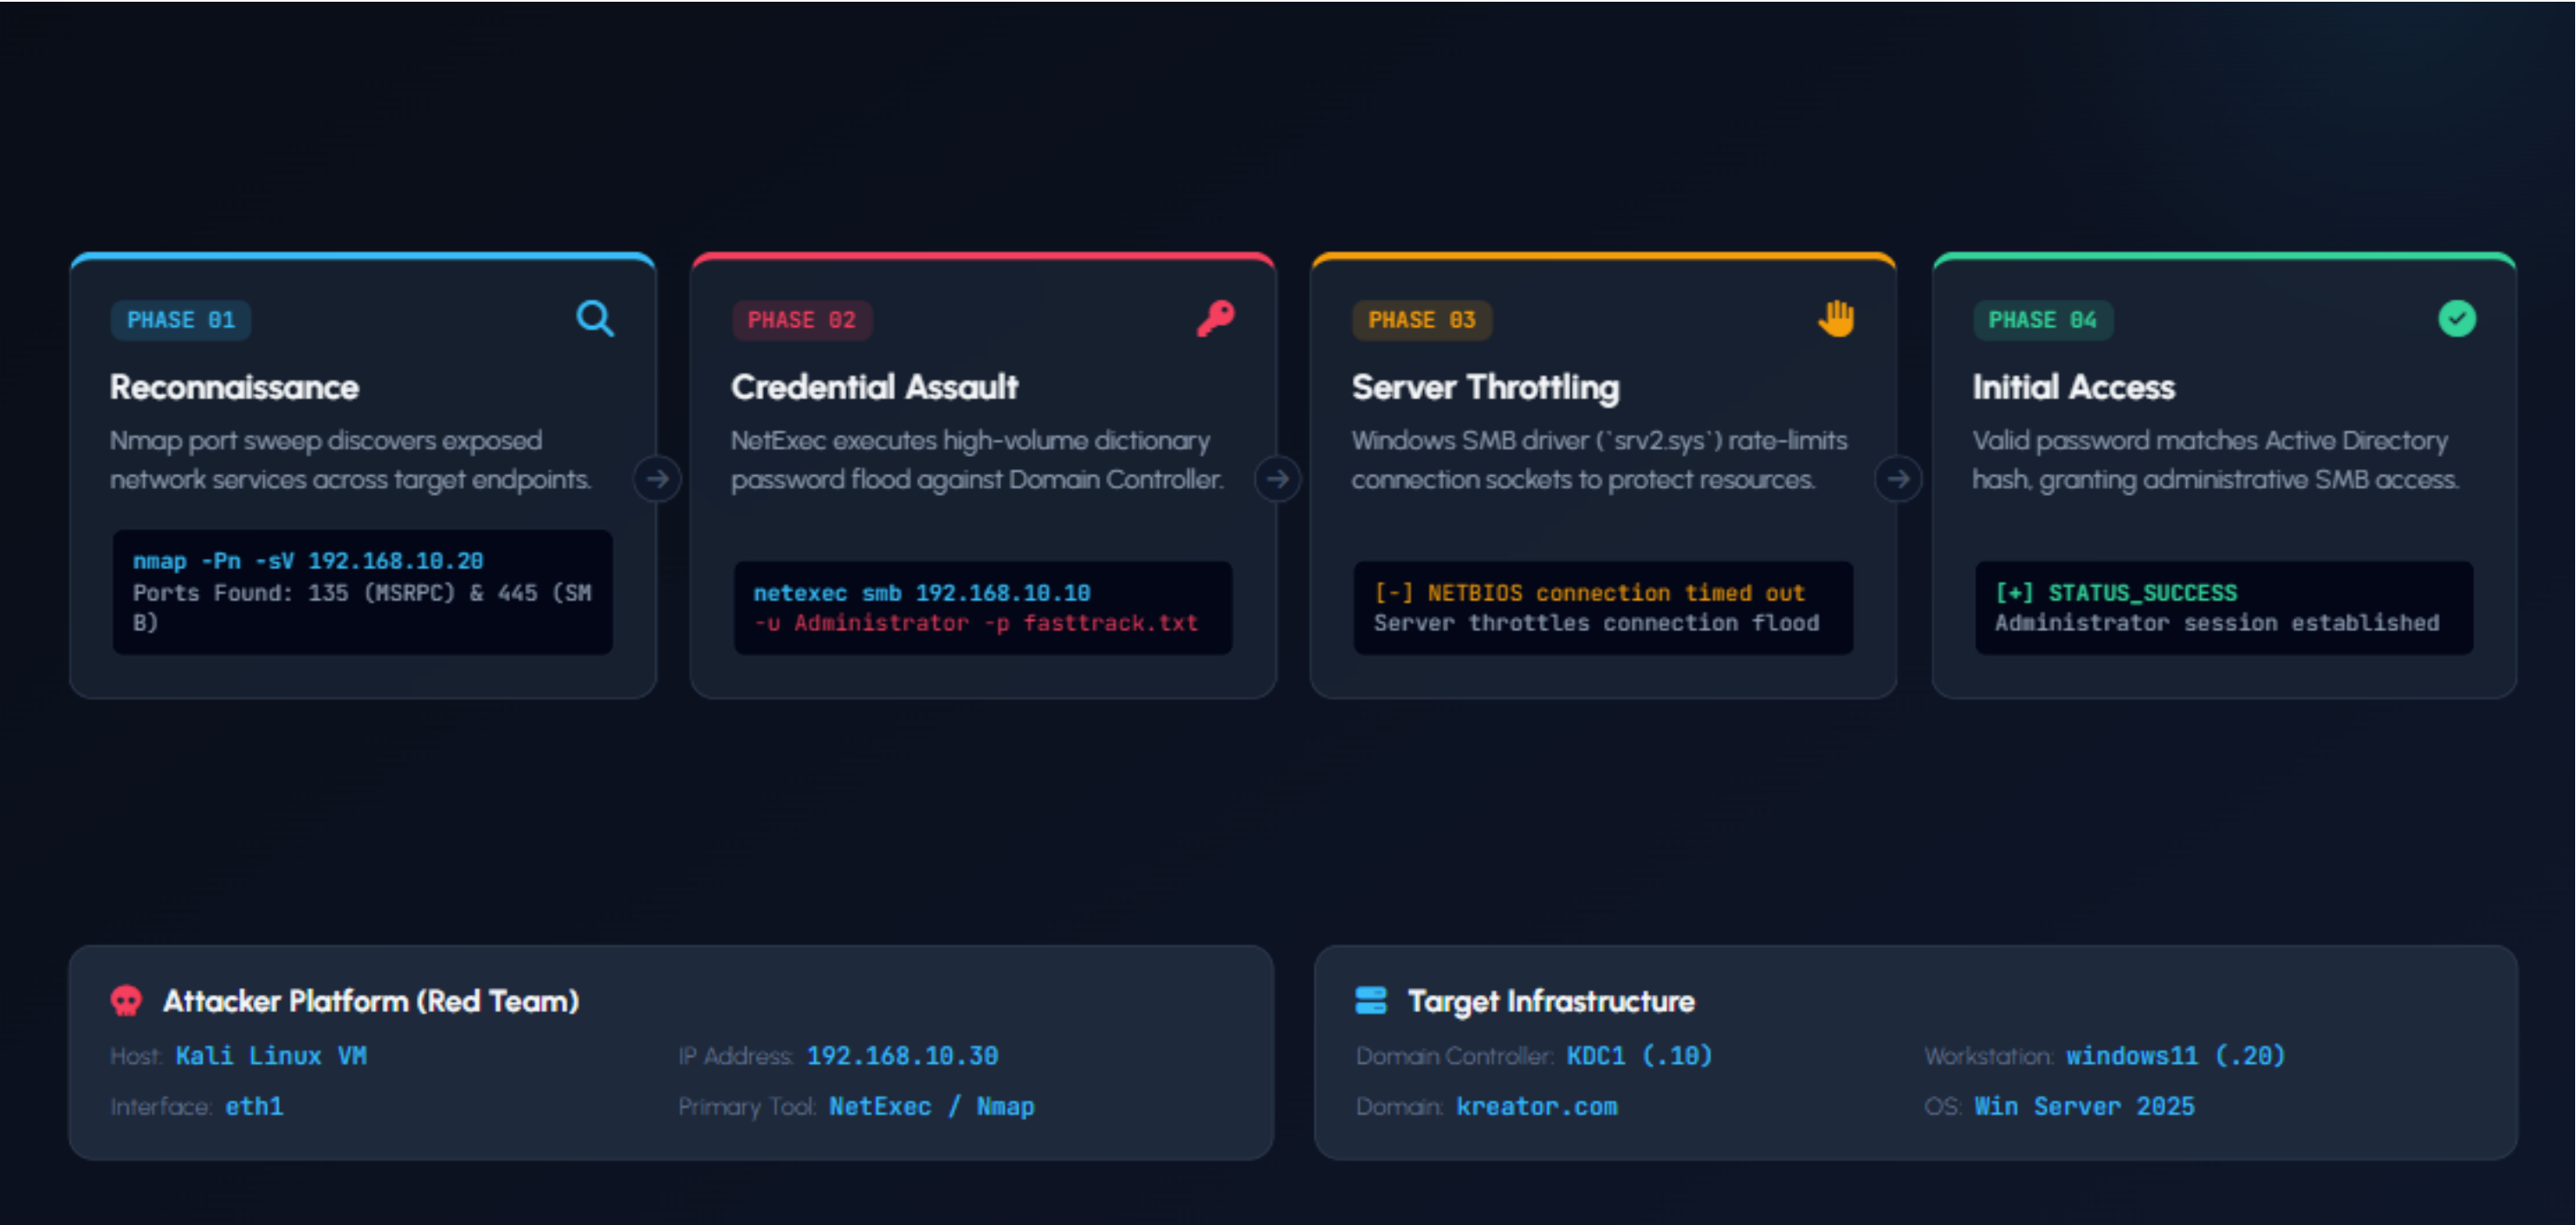

Dual-Adapter Network Architecture & Baseline Topology

Traffic Analysis & Deep Packet Inspection (Wireshark PCAP)

Device / Hostname	IP Address	Expected Protocols & Ports	What Normal Traffic Looks Like
Domain Controller (KDC1)	192.168.10.10	• DNS (53) • Kerberos (88) • LDAP (TCP 389) • SMB (TCP 445)	Workstations requesting domain name resolution, user login tickets, and Group Policy updates over SMB.
Workstation (windows11)	192.168.10.20	• MSRPC (TCP 135) • DHCP / DNS	Standard client endpoint communicating with the Domain Controller to refresh policies and authenticate users.
SIEM Server (Host)	192.168.56.1	• Splunk Ingestion (TCP 9997)	Universal Forwarders on server, kali, workstation streaming Windows Event Logs and linux log to Splunk over the Host-Only adapter.

DELIVERABLE 3 — TASKS 2 & 4: LOG INGESTION & SIEM PIPELINE

DELIVERABLES 5 & 6 — TASKS 6 & 7: THREAT HUNT & INCIDENT TIMELINE

Eradication

Recovery

Find it: In **Splunk**, I queried `index=* EventCode=4625` to isolate thousands of failed SMB logon attempts and traced the source IP back to my Kali machine (192.168.10.30).

Stop it: I blocked the Kali IP at the network boundary and disabled the targeted Administrator account in **Active Directory Users and Computers**.

Clean it: I killed active SMB connections, checked Splunk for EventCode 4624 across the network, and verified in Event Viewer that no rogue services (Event 7045) or backdoor users (Event 4720) were installed.

· **Fix it:** I reset the account to a strong passphrase, re-enabled it, and enforced an **Account Lockout Policy** in Group Policy to automatically prevent automated brute-force attacks moving forward."*
